Homebound status: Due to diagnosis of Encounter For Surgical Aftercare Following Surgery On The Digestive System, the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device.

Clinical Condition Requiring Homecare:

The patient is a 75-year-old female with a complex medical history notable for invasive ductal carcinoma of the left breast (likely a transcription error in the original note), multiple embolic cerebrovascular accidents in 2011 secondary to a left ventricular thrombus with residual right-sided weakness and aphasia, heart failure with reduced ejection fraction, chronic kidney disease stage 3b, hypertension, hyperlipidemia, and diabetes mellitus. She was recently hospitalized for perforated appendicitis requiring laparoscopic appendectomy complicated by a prolonged recovery with leukocytosis, hypoxia, and coffee-ground emesis; she was subsequently discharged to a skilled nursing facility and is now referred for home health services for disease- and medication-education and physical therapy to address ongoing functional decline. On evaluation she was alert but not fully oriented and largely nonverbal, providing only one-word responses ("ok"); her sister, the primary caregiver, was present and supplied the history and answered questions during the visit. The caregiver reports the patient is incontinent of both urine and stool. On examination the lungs were clear to auscultation, bowel sounds were audible, and pulses were palpable in all extremities; vital signs were obtained and the admission process completed. Continued home health support is recommended for caregiver education, medication management, mobility/ADL assistance, continence and skin care, and close monitoring for medical complications.
