SELF-CARE: 3. Independent - Patient completed all the activities by him/herself, with or without an assistive device, with no assistance from a helper., MOBILITY: 3. Independent - Patient completed all the activities by him/herself, with or without an assistive device, with no assistance from a helper.				family/caregiver will be responsible for managing treatment	
Homebound status:				Homebound status:	
Due to diagnosis of Unspecified Intracapsular Fracture Of Right Femur, Subsequent Encounter For Closed Fracture With Routine Healing, the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device.				Due to diagnosis of Unspecified Intracapsular Fracture Of Right Femur, Subsequent Encounter For Closed Fracture With Routine Healing, the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device.	
Clinical Condition Requiring Homecare:				Clinical Condition Requiring Homecare:	
<div>The patient is an 86-year-old Ethiopian female who was admitted to the agency following an open reduction and internal fixation (ORIF) procedure after a right hip hemiarthroplasty performed on July 15, 2025, due to an acute, unspecified right femoral neck fracture. The patient initially presented to Virginia Hospital Center on July 14, 2025, with severe right leg pain and was diagnosed with the fracture. Following the hemiarthroplasty, she required a postoperative blood transfusion secondary to anemia and was subsequently transferred to Carlin Springs Rehabilitation Center for further recovery. During her rehabilitation stay, the patient sustained an additional unspecified fall that resulted in a right humeral shaft fracture, which required ORIF with bone grafting. She continues to wear a right shoulder sling for immobilization. Her past medical history is significant for arteriovenous malformation (AVM), end-stage renal disease (ESRD) requiring dialysis, hypertension, hyperlipidemia, osteoarthritis, atherosclerotic heart disease of native coronary arteries without angina, aortic atherosclerosis, gastroesophageal reflux disease (GERD), lumbar and sacral spinal stenosis without neurogenic claudication, history of appendicitis with laparoscopic appendectomy, previous falls, and a left 10th rib fracture. The patient resides alone in an apartment and utilizes interpreter services for communication, as she speaks Amharic. A private caregiver and home health aide (HHA) assist her Monday through Friday from 8:00 a.m. to 5:00 p.m. She is currently fully dependent on her HHA for all activities of daily living (ADLs), including grooming, dressing, bathing, toileting, medication management, meal preparation, and transfers. Although she has been cleared to bathe in a tub or shower, she is unable to access the tub safely and therefore performs sponge baths at the sink. Prior to this recent hospitalization, the patient and her caregiver report that she was independent in all ADLs and functional mobility. On <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-8 CE-FMS-assessment">assessment</mh>, the patient was alert and oriented to person and place, denied vision or hearing impairment, and required assistance from her caregiver for translation. She demonstrated significant decreases in lower extremity strength, joint mobility, activity tolerance, endurance, and standing and ambulation capacity. A home exercise program (HEP) was initiated during this visit, with seated and standing bilateral lower				<div>The patient is an 86-year-old Ethiopian female who was admitted to the agency following an open reduction and internal fixation (ORIF) procedure after a right hip hemiarthroplasty performed on July 15, 2025, due to an acute, unspecified right femoral neck fracture. extremity therapeutic exercises, transfer training, and ambulation instruction. Education was provided to both the patient and caregiver regarding home safety, appropriate mobility techniques, and exercise performance. Both verbalized understanding and agreement with the plan. The patient would benefit from continued skilled physical therapy services to improve strength, endurance, balance, and overall functional mobility, enhance safety with transfers and ambulation, and maximize independence in daily activities with the goal of returning to her prior level of function.</div><div>
