Clinical Condition Requiring Homecare: <div>The patient is an 86-year-old woman with a history of dementia who was recently hospitalized for urinary tract infection, dehydration, pneumonia, and sepsis and has now been admitted to home health for continued post-acute care. On assessment she was pleasant but intermittently confused and occasionally agitated, and demonstrated moderate generalized weakness that limits her mobility and increases her fall risk. She lives in a single-family home with significant others; her daughter <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-9 CE-FMS-visits">visits</mh> daily and provides supervision and assistance with care. Because hospital records were limited at the time of the visit, I am assuming she received appropriate inpatient stabilization (IV fluids/antibiotics and monitoring) and was discharged with a medication plan - this needs verification on first home visit and reconciliation of current medications and discharge orders. Vital signs and current laboratory values were not available in the assessment provided and should be obtained by the nurse on first visit.&nbsp; Care provided/education given included counseling the daughter and caregivers on signs and symptoms of recurrent infection or clinical deterioration (fever, increased confusion, decreased oral intake, decreased urine output, worsening cough or shortness of breath), the importance of maintaining hydration and nutrition, safe transfer and fall-prevention strategies given the patient's weakness and cognitive impairment, and the need for strict medication adherence and monitoring. The plan of care is to initiate skilled nursing for medication reconciliation, monitoring of vitals and fluid status, and coordination with the primary care physician to confirm antibiotic regimen and follow-up orders; initiate physical therapy evaluation to address deconditioning and safe mobility as tolerated; implement fall-risk precautions and caregiver training for supervision and safe transfers; and arrange for close follow-up (RN <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-9 CE-FMS-visits">visits</mh> at least initially, with increased frequency as clinically indicated) to monitor cognition, respiratory status, and resolution of infection. If confusion or agitation worsen, or if there is any evidence of recurrent infection, hypoxia, poor intake, or hemodynamic instability, the family was instructed to contact the provider or seek emergency care immediately.</div><div> </div><div>
