22.B.Discharge Plans

patient will be responsible for managing treatment

Homebound status:

Due to diagnosis of Essential Primary Hypertension , the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device.

Clinical Condition Requiring Homecare:

The patient is a 73-year-old male with a medical history significant for peripheral vascular disease, hypertension, and cerebrovascular accident, who was hospitalized on May 25 for a right above-knee amputation. He resides alone in an elevator-accessible senior apartment building and currently receives Meals on Wheels services, though he reports a need for additional transportation support. He is followed by an in-home physician and has not yet been fitted for a prosthesis. Prior to hospitalization, the patient was independent with basic self-care, functional transfers, and mobility tasks. At present, he demonstrates decreased standing balance, reduced activity and standing tolerance, and diminished bilateral upper-extremity strength, contributing to decreased independence in self-care, transfers, and functional mobility. He performs bed mobility independently and is able to transfer from wheelchair to bed using a transfer board without assistance; transfers to the toilet and bed via stand-pivot require supervision for safety. The patient is considered homebound due to the significant physical effort required to leave his residence in a wheelchair and a Tinetti score of 5/28, indicating a high fall risk. He was instructed to wear his residual limb shrinker continuously (24 hours per day) and to engage in prone-lying for 30 minutes daily to maintain hip extension and minimize contracture development. The patient would benefit from social work involvement to secure transportation services, as well as a home health aide to assist with bathing until he becomes confident using the tub bench. Skilled home therapy, including occupational therapy, is recommended to improve strength, restore functional independence, and initiate preparatory training for future prosthetic use.
