20. Prognosis: fair				
22. A Rehabilitation Potential: SELF-CARE: , MOBILITY:		22.B.Discharge Plans patient will be responsible for managing treatment		
Homebound status: Due to diagnosis of Other Intraoperative And Postprocedural Complications And Disorders Of The Musculoskeletal System, the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device.				
Clinical Condition Requiring Homecare: <div>The patient is a 73-year-old male with a complex medical history that includes osteomyelitis of the left radius and ulna, hypertension, hypothyroidism, chronic pain, anxiety, depression, osteoarthritis of the left elbow, gastroesophageal reflux disease (GERD), glaucoma, allergic rhinitis, Crohn's disease, right macular degeneration, hearing impairment, and a history of multiple orthopedic surgeries. He also has a history of disruption of an external operative wound, infection following a surgical procedure, and arthrodesis status. The patient lives alone in a single-family home but receives assistance from his daughter as needed. The patient was admitted to home health services following prolonged hospitalization and stays in rehabilitation facilities totaling approximately four months, related to osteomyelitis of the left wrist and forearm complicated by infection requiring intravenous (IV) antibiotic therapy. He currently receives Primaxin 500 mg IV every 12 hours via a peripherally inserted central catheter (PICC) located in the right upper chest for treatment of Mycobacterium abscessus-associated tenosynovitis. The PICC line site was assessed during this visit, with the dressing clean, dry, and intact, and no signs of erythema, swelling, or drainage noted. The patient is instructed to flush the line with 5 mL of saline daily to maintain patency. He retains supplies from previous IV therapy sessions. On <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-8 CE-FMS-assessment">assessment</mh>, the patient was alert and oriented 3-4 and in no acute distress. He reported left upper extremity pain rated at 4/10, stiffness, and limited active range of motion (AROM) of the left wrist and fingers. The left elbow exhibits decreased mobility due to osteoarthritis. The patient has an unsteady gait and reports dyspnea on exertion but denies dizziness or recent falls. Lung sounds were clear bilaterally, and a deep cough was noted without abnormal findings. He denies abnormal bleeding or bruising. Bowel movements are regular, and the patient noted improved stool consistency since discharge. He also reported use of an artificial urinary sphincter ("button") to aid urination, with decreased stream strength but no pain. The patient's psychiatric history includes depression and anxiety; he reports occasional shakiness but denies suicidal ideation. Visual <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-8 CE-FMS-assessment">assessment</mh> is notable for glaucoma and right macular degeneration, for which he receives ocular injections at Wilmer Eye Clinic. He ambulates without an assistive device but owns a cane for support. Medication reconciliation was performed, and the patient demonstrated good understanding of his medication regimen, identifying most drugs by both brand and generic names and describing their purpose and dosing instructions. Skilled nursing care focused on <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-8 CE-FMS-assessment">assessment</mh> of infection control, pain management, medication review, and reinforcement of proper PICC line care. Physical and occupational therapy evaluations were ordered to address weakness, balance, and functional limitations. The patient was instructed on a home exercise program including long arc quads, marching, side kicks, and mini squats, 10 repetitions 2 sets daily, to improve lower extremity strength and endurance. Education was provided regarding infection prevention, safe ambulation, proper breathing techniques for exertional dyspnea, and adherence to antibiotic therapy. The patient verbalized understanding of all instructions. Upcoming appointments include: surgical follow-up for suture removal on 10/20 at Greenspring Station, urology on 10/30, infectious disease video consultation on 10/31, and cardiology on 11/11. The plan of care includes continued skilled nursing <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-1 CE-FMS-visits">visits</mh> to monitor wound status, PICC line management, pain control, and medication compliance, along with coordination of care among his multidisciplinary team to optimize recovery and functional independence.</div><div>
