Clinical Condition Requiring Homecare:					
Start of care and physical therapy evaluation were completed for this 77-year-old Hispanic female who presented to the hospital following a fall at home resulting in a left femoral neck fracture. The patient underwent left short cephalomedullary nail insertion surgery on 01/11/2026. Her past medical history is significant for hypertension, right knee osteoarthritis, type II diabetes mellitus, chronic kidney disease, and hypothyroidism. The patient is Spanish-speaking only; her son and daughter were present during <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-1 CE-FMS-visits">visits</mh> to assist with translation. She resides in a multilevel home with multiple family members and was reportedly independent with all activities of daily living (ADLs) and functional mobility prior to the fall. On <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-8 CE-FMS-assessment">assessment</mh>, the patient was found in bed, alert and oriented to person, place, time, and situation, wearing reading glasses. Facial symmetry was intact, and bilateral hand grasps were equal and strong. Sensation was intact. Posterior lung fields were clear to auscultation. The abdomen was soft and non-tender with active bowel sounds in all four quadrants. The patient is incontinent of bladder but denies dysuria or burning with urination. Examination of the left lower extremity revealed edema with faint palpable pulses; elevation was encouraged to reduce swelling. The surgical site to the left hip is covered with a non-removable dressing per postoperative protocol. The patient reports left leg pain with partial relief from prescribed oxycodone. She also reports a history of chronic right knee pain. Functionally, the patient is currently wheelchair-bound and requires human assistance for locomotion. She requires minimal to moderate assistance to supervision for basic grooming and bathing ADLs, as well as assistance with management of oral medications and meal preparation. She is able to feed herself with setup assistance. She requires some assistance for bed mobility, including transitions from supine and long sitting to short sitting. The patient is able to perform sit-to-stand and stand-to-sit transfers using a rolling walker with minimal to standby assistance for safety. She currently requires supervision for ambulation with a rolling walker indoors and would require use of the rolling walker for outdoor ambulation to ensure safety and stability. Stair training was attempted; however, the patient declined due to fear of falling. This will be reassessed at the next follow-up visit. Strength, endurance, standing tolerance, balance, and overall functional mobility are decreased compared to prior level of function. Education was provided regarding safe home setup, fall prevention strategies, and proper mobility techniques within the home. Gait training with the rolling walker was initiated, along with instruction on safe performance and optimal location for the home exercise program (HEP). A HEP was initiated during this session, including seated and standing bilateral lower extremity therapeutic exercises. The patient was advised to use a sturdy chair with adequate back support and bilateral armrests when performing sit-to-stand exercises. A sock aid was recommended to increase independence with lower body dressing. The patient and family members verbalized understanding and demonstrated appropriate return demonstration of instructed exercises and safety techniques. Skilled physical therapy services are medically necessary to address deficits in strength, endurance, balance, and functional mobility, with the goal of improving safety, increasing independence with ADLs and ambulation, and facilitating return to prior level of function. Continued therapy will focus on progressive strengthening, gait training, stair negotiation as tolerated, balance training, and functional mobility retraining.</div><div>
