patient will be responsible for managing treatment

Homebound status: Due to diagnosis of Encounter For Other Orthopedic Aftercare, the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device.

Clinical Condition Requiring Homecare:

The patient is a 62-year-old female with a past medical history significant for anemia, anxiety, asthma, fatty liver disease, GERD, claustrophobia, hyperlipidemia, hypertension, hypertrophic obstructive cardiomyopathy, neck pain, obstructive sleep apnea, osteoarthritis, prediabetes, and ulcerative colitis. She was admitted to home health services following cervical spine surgery for cervical myelopathy, including anterior cervical decompression and fusion (C2-3), anterior cervical discectomy and fusion with instrumentation from C2-T1, removal of hardware, posterior cervical fusion from the occiput to T2, and a partial thyroidectomy. She requires skilled PT and OT services as well as medication education. The patient is currently wearing a rigid cervical collar at all times except when showering and is maintaining cervical spinal precautions. Surgical incisions are healed; however, she reports an itchy rash on her back and buttocks that began during hospitalization and is being treated with prescribed topical medication. Medication reconciliation was completed with her daughter, as the patient reported difficulty keeping up with new medications, and medication education is included in the plan of care. On <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-8 CE-FMS-assessment">assessment</mh>, vital signs were obtained and the patient was admitted to home health. She resides with her daughter in a multilevel home with a first-floor setup and is currently sleeping in a recliner. Prior to hospitalization, she ambulated with a rollator at modified independence but had difficulty with stairs due to knee pain. Currently, she demonstrates decreased bilateral lower extremity strength (3/5 MMT), requires contact guard assistance for transfers and short-distance ambulation with a rolling walker, and is unable to attempt stair negotiation due to pain. She requires moderate assistance with lower body dressing, minimal assistance with upper body dressing, contact guard assistance for sit-to-stand and toilet transfers with verbal cueing, and assistance with sink-side bathing due to cervical precautions and inability to reach overhead. Her daughter assists with medication management, bathing, dressing, and all instrumental activities of daily living. The patient was instructed in seated lower extremity therapeutic exercises and encouraged to ambulate at least every two hours to avoid prolonged sitting. She would benefit from continued skilled PT and OT services to improve strength, balance, safety, and functional mobility in order to return to her prior level of function.
