SELF-CARE: 2. Needed Some Help - Patient needed partial assistance from another person to complete any activities., MOBILITY: 2. Needed Some Help - Patient needed partial assistance from another person to complete any activities.			patient will be responsible for managing treatment		
Homebound status:			Due to diagnosis of Type 2 Diabetes Mellitus With Diabetic Chronic Kidney Disease, the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device.		
Clinical Condition			<div>The patient is a 69-year-old individual referred to home health care services following a prolonged hospitalization and rehabilitation stay from September 30 through January 8 for complications related to congestive heart failure exacerbation, hypoxic respiratory failure, and associated medical decline. The patient resides in a multilevel row-style home with family, including a daughter who serves as the primary caregiver, as well as a son-in-law and grandchild. The home has four steps to enter, with the primary bedroom and full bathroom located on the second floor and a powder room on the first floor. The family is in the process of relocating the patient's bedroom to the main level to improve safety and accessibility. The patient was alert and oriented at the time of assessment and utilizes hearing aids, denying any visual impairment. The patient's past medical history is significant for congestive heart failure, cardiomyopathy, type 2 diabetes mellitus, hypertension, chronic kidney disease, end-stage renal disease, anemia, deep vein thrombosis, HIV, gastroesophageal reflux disease, dysphagia, obstructive sleep apnea, osteoarthritis of both knees, depression, anxiety, and right foot drop. The patient is currently non-ambulatory for community distances and demonstrates significant functional limitations. Within the home, the patient ambulates approximately 15 feet twice using a small-based quad cane with supervision, frequently reaching for surrounding objects for stability. The patient requires moderate assistance to ascend two steps using a handrail and cane, particularly to lift the left lower extremity onto the step. Transfers from sitting to standing from a recliner are performed with supervision. The patient declined bed mobility assessment and therapeutic exercise during the visit due to fatigue. Outside ambulation, car transfers, and extended mobility were not assessed. The patient is considered homebound due to the significant effort required to leave the home, reliance on an assistive device, poor endurance, and impaired balance, as evidenced by a Tinetti score of 11/28. The patient presents with multiple wounds requiring skilled management. A left lower leg venous stasis ulcer is present, with prescribed wound care including cleansing with wound cleanser, patting dry, application of alginate dressing, coverage with an abdominal pad, and securing with wrap gauze and tape on a daily basis. The patient also has a right heel diabetic ulcer with prescribed care consisting of cleansing with wound cleanser, patting dry, application of Xeroform dressing, coverage with a dry sterile dressing, and securing with wrap gauze and tape daily. Additionally, the patient has two stage II pressure injuries located at the midline lower back and sacrum, with prescribed care to cleanse with mild soap and water, pat dry, and apply Allevyn foam dressings every three days for protection. The patient's daughter performs wound care between skilled nursing <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-9 CE-FMS-visits">visits</mh>. Supplies required for ongoing wound care

include wound cleanser, 4x4 gauze, alginate dressings, Xeroform, abdominal pads, wrap gauze, tape, medium gloves, and foam dressings. The patient has a feeding tube that is intact and functioning properly. The daughter declined tube feeding education during this visit, stating that the patient is currently tolerating adequate oral intake of a soft diet since discharge. Education was provided regarding the importance of monitoring nutritional intake, skin integrity, signs and symptoms of infection, and when to notify the agency or physician of changes in condition. Physical and occupational therapy evaluations were ordered. Occupational therapy evaluation identified the need for activities of daily living training, adaptive equipment education, functional mobility training, therapeutic exercise, home exercise program instruction, energy conservation strategies, and safety training. A recommendation was made for installation of a grab bar near the toilet to improve bathroom safety. Occupational therapy is recommended at a frequency of one visit per week for four weeks. The patient would benefit from home-based therapy services to improve strength, endurance, functional mobility, and overall safety in order to maximize independence within the home environment. Skilled nursing services are recommended at a frequency of one visit per week for one week, followed by two <mh class="chrome-extension-FindManyStrings chrome-extension-FindManyStrings-style-9 CE-FMS-visits">visits</mh> per week for two weeks, and then one visit per week for four weeks. Skilled nursing will address disease process management, cardiopulmonary assessment, wound care monitoring, medication management, skin integrity assessment, and ongoing patient and caregiver education. The next skilled nursing visit is scheduled for Tuesday.</div><div> </div><div>
