Z87.891	Personal history of nicotine dependence	04/23/26			
14. DME and Supplies:			15. Safety Measures:		
cane, rolling walker			fall precautions, bathroom safety, standard precautions, , ambulates with device, ambulates with assistance		
16. Nutrition:			17. Allergies:		
regular			codeine percocet adhesive tape		
18.A. Functional Limitations			18.B. Activities Permitted		
Ambulation			Up As Tolerated		
19. Mental & Pyschosocial Status: COGNITION: 0. Alert/ oriented, able to focus and shift attention, comprehends and recalls task directions independently., ANXIETY: 0. Never, SOCIAL ISOLATION: 3. Often, BEHAVIORAL ISSUES: 7. None of the above behaviors demonstrated, HISTORY OF DEPRESSION: Yes					
20. Prognosis: fair					
22. A Rehabilitation Potential:			22.B.Discharge Plans		
SELF-CARE: 3. Independent - Patient completed all the activities by him/herself, with or without an assistive device, with no assistance from a helper., MOBILITY: 1. Dependent - A helper completed all the activities for the patient.			SN: patient will be responsible for managing treatment PT: patient will be responsible for managing treatment		
Homebound status: Due to diagnosis of Acute pain due to trauma, the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device.					
Clinical Condition Requiring Homecare: <div>The patient is a 73-year-old female with a past medical history significant for coronary artery disease (CAD), hypertension, depression, gout, and chronic pain related to arthritis. She was recently admitted to the emergency department following a fall at home while attempting to get into bed, during which she fell onto the side of the bed. The patient reports progressive generalized weakness without a clearly identified cause despite prior hospital evaluation. She denies suicidal ideation but endorses persistent depressive symptoms, including social withdrawal, poor sleep, and decreased appetite. She is followed by psychiatry every three months but reports her current antidepressant regimen as ineffective. Additionally, she missed a recent pain management appointment. Skilled nursing services have been initiated with a focus on medication management and disease process education related to gout, depression, hypertension, and pain management, with a planned visit frequency of 1 week for 1 visit, followed by 2 weeks for 1 visit, and then 1 week for 3 visits. Admission paperwork has been completed, and the patient agrees with the plan of care. Physical therapy evaluation was completed following hospitalization approximately two weeks prior for a fall associated with significant weakness, during which the patient was unable to get up independently. The patient reports a gradual decline in functional mobility over the past year secondary to chronic arthritic pain. Although inpatient rehabilitation was recommended, the patient declined in order to remain at home to assist in the care of her spouse, who is suspected to have Alzheimer's disease or dementia. The patient resides in a mobile home with her spouse, who is present at all times and able to provide assistance as needed; additional family support is also available. The home has three steps to enter. The patient ambulates within the home using a four-wheeled walker and reports three falls within the past two months. On assessment, the patient demonstrates multiple functional impairments, including right hip and left shoulder pain, decreased bilateral lower extremity strength, impaired balance, unsteady gait, decreased safety awareness, difficulty with transfers and stair negotiation, and overall reduced functional mobility, placing her at high risk for falls. She requires minimal assistance to standby assistance for transfers and standby assistance for ambulation with a walker. Standardized assessments, including the Tinetti and Timed Up and Go (TUG), were performed to evaluate fall risk and mobility. The patient was instructed extensively in fall prevention strategies, home safety measures, and safe use of her walker, including proper hand and foot placement, forward weight shifting, and controlled descent when sitting. Education was also provided on the importance of consistent use of the walker for all ambulation. A progressive walking program was initiated, with instructions to perform short walks within the home every 1-2 hours and gradually increase duration from 3-5 minutes as tolerated. The patient was also instructed in pain management techniques, including appropriate timing of pain medication (ideally one hour prior to therapy sessions), monitoring for side effects such as dizziness and constipation, and use of ice therapy to the right hip for 20 minutes with appropriate skin protection and frequent checks. She was advised to seek immediate medical attention for chest pain, unrelieved pain, or shortness of breath. The patient verbalized understanding of all education provided. The patient is considered homebound due to her high fall risk, pain, weakness, and need for human assistance and an assistive device for safe mobility. Leaving the home requires considerable and taxing effort and poses a safety risk. Skilled physical therapy services are indicated and have been initiated with a frequency of 1 visit for 1 week, followed by 2 visits per week for 1 week, then 1 visit per week for 3 weeks, focusing on improving strength, balance, functional mobility, transfer safety, gait, and fall prevention to restore independence. The plan of care was reviewed and agreed upon by the
