14. DME and Supplies:			15. Safety Measures:		
wound care supplies			medication safety, ambulates with assistance, standard precautions, fall precautions, diabetic precautions, activity supervision		
16. Nutrition:			17. Allergies:		
diabetic			aspartame cephalixin		
18.A. Functional Limitations			18.B. Activities Permitted		
Ambulation, Endurance			Up As Tolerated		
19. Mental & Pyschosocial Status:			COGNITION: 0. Alert/ oriented, able to focus and shift attention, comprehends and recalls task directions independently., ANXIETY: 0. Never, SOCIAL ISOLATION: 0. Never, BEHAVIORAL ISSUES: 1. Memory deficit: failure to recognize familiar persons/places, inability to recall events of past 24 hours, significant memory loss so that supervision is required2. Impaired decision-making: failure to perform usual ADLs or IADLs, inability to appropriately stop activities, jeopardizes safety through actions, HISTORY OF DEPRESSION: Yes		
20. Prognosis:			good		
22. A Rehabilitation Potential:			22.B.Discharge Plans		
SELF-CARE: 3. Independent - Patient completed all the activities by him/herself, with or without an assistive device, with no assistance from a helper., MOBILITY: 3. Independent - Patient completed all the activities by him/herself, with or without an assistive device, with no assistance from a helper.			family/caregiver will be responsible for managing treatment		
Homebound status:			Due to diagnosis of Infection following a procedure, superficial incisional surgical site, initial encounter, the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device.		
Clinical Condition			<div>The patient is a 78-year-old female admitted to home health services following a recent vulvectomy and subsequent flap surgery related to vulvar cancer diagnosed in February 2026. Her past medical history is significant for hyperlipidemia, Type 2 diabetes mellitus managed with weekly Mounjaro injections, anxiety, and depression. The patient underwent vulvectomy last month at Johns Hopkins Hospital. Although her immediate postoperative recovery was initially uncomplicated and she was discharged home, she later developed a postoperative wound infection identified during a follow-up surgical visit, requiring readmission to acute care hospitalization for further management. During hospitalization, the patient received intravenous antibiotics and was subsequently transitioned to oral antibiotic therapy. Her hospital course was further complicated by episodes of delirium, confusion, and impaired decision-making capacity; however, both the patient and family report that her mental status has significantly improved since discharge. The patient is now receiving home health skilled nursing services for ongoing comprehensive assessment and management, including cardiopulmonary monitoring, medication management, wound assessment and treatment, infection prevention education, safety monitoring, and disease process education. Skilled wound care was performed during the visit in accordance with physician orders for management of the postoperative vulvar surgical wound and flap site. The patient tolerated wound care procedures well without signs of distress or complications. No acute respiratory distress or cardiopulmonary abnormalities were noted during the visit. Ongoing monitoring of wound healing and infection status remains necessary due to the patient's recent postoperative infection history, advanced age, diabetes, and overall weakened condition. Extensive education was provided to the patient and caregiver regarding signs and symptoms of infection, proper wound care techniques, medication adherence, diabetic management, fall prevention strategies, pressure injury prevention, and indications for notifying the physician or seeking emergency medical attention. Reinforcement was also provided regarding maintaining adequate nutrition, hydration, and glycemic control to promote optimal wound healing. The patient remains homebound secondary to decreased strength, impaired mobility, limited endurance, postoperative weakness, and the need for assistance to safely leave the home environment. Continued skilled nursing services are medically necessary to monitor wound healing progression, prevent complications and rehospitalization, provide ongoing medication and disease management education, and ensure patient safety during postoperative recovery. The patient and caregiver verbalized understanding of all teaching provided and are in agreement with the established plan of care.</div><div>Date of Order</div><div>Date of Order</div></div>
