Clinical Condition Requiring Homecare:

The patient is a 62-year-old male with a complex medical history including chronic hepatitis B and C, end-stage renal disease status post kidney transplant (2022), chronic kidney failure requiring dialysis with multiple graft placements (left arm reserved for blood pressure measurements), chronic myelogenous leukemia, hypertension, benign prostatic hyperplasia, pulmonary hypertension, and lumbar radiculopathy, referred for skilled home health physical therapy following hospitalization and a skilled nursing facility stay due to difficulty with ambulation. He resides on the second floor of a home with his supportive brother and sister-in-law, without a stair lift, and uses a walker for mobility, reporting greater stability with it compared to a cane. Previously independent without an assistive device, he now presents with bilateral lower extremity weakness, impaired dynamic standing balance, decreased endurance, and gait dysfunction, ambulating 25-50 feet with a rolling walker and moderate assistance, demonstrating poor foot clearance and reduced step length. He requires moderate assistance for transfers and increased time and effort for bed mobility, and is unable to safely negotiate stairs or manage a tub threshold. Vital signs are stable, and the patient reports adherence to his medication regimen. He is considered homebound due to reliance on a walker and need for assistance with activities of daily living, with notable fall risk. Home safety recommendations were provided, including development of a fire safety plan, installation of non-slip mats and grab bars, and improved room organization. The patient would benefit from continued skilled home health physical therapy to address strength, balance, gait, and functional mobility deficits, with the goal of improving safety and reducing risk of falls and rehospitalization.<o:p></o:p> <o:p> </o:p> Date of Order<o:p></o:p> 04/27 /2026
