patient will be responsible for managing treatment

Homebound status:

After undergoing Right Total Hip Replacement surgery, the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device.

Clinical Condition Requiring Homecare:

The patient is a 53-year-old male on postoperative day one following a right total hip arthroplasty (THA). He resides with his supportive wife, who assists with his daily needs. Prior to surgery, he was independent with ambulation without an assistive device. At the time of assessment, his pain was well controlled with a scheduled medication regimen, and he was ambulating with a rolling walker as instructed. He demonstrated right lower extremity weakness (3-/5 manual muscle testing), requiring contact guard assistance for transfers and short-distance ambulation. Right knee range of motion measured -5 degrees of extension to 95 degrees of flexion, which the patient reports is his baseline due to previous surgeries. The surgical incision was clean, dry, and intact, with no signs or symptoms of infection or drainage, and vital signs were stable. The patient has been compliant with his initial home exercise program, including seated therapeutic exercises, and was successfully instructed in standing exercises using a rolling walker for support. He was educated on postoperative precautions and the importance of adhering to postoperative instructions, demonstrating understanding without questions or concerns. The patient would benefit from skilled physical therapy to improve strength, range of motion, safety with functional mobility, and overall independence to facilitate a return to his prior level of function.<o:p></o:p>   Date of Order<o:p></o:p> 06<span
