Homebound status: Due to diagnosis of Spinal stenosis, lumbar region without neurogenic claudication, the patient is experiencing decreased endurance and mobility, increasing the likelihood of falls. To safely leave their home, the patient needs assistance from another person and an assistive mobility device									
Clinical Condition Requiring Homecare: <p class="p">The patient is a 78-year-old male with a past medical history of spinal stenosis, hypertension, chronic kidney disease (CKD), and type 2 diabetes mellitus (DM2) who is homebound due to impaired mobility and an increased risk of falls. He ambulates with a rolling walker and requires assistance from another person when leaving the home for safety. The patient was recently hospitalized for worsening pain. On assessment, he was alert and oriented 3, with warm, dry, and intact skin, clear lung sounds, even and unlabored respirations, and no complaints voiced. A physical therapy evaluation was completed and revealed decreased bilateral lower extremity strength (3-/5 MMT). The patient requires minimal assistance for transfers and short-distance ambulation with a rolling walker, along with verbal cues to improve trunk extension. Prior to hospitalization, he was able to ambulate short distances with a rolling walker under supervision. The patient would benefit from skilled physical therapy to improve strength, balance, safety, and functional mobility to facilitate a return to his prior level of function.<o:p></o:p></p><p class="p"> </p><p class="15">Date of Order<o:p></o:p></p><p class="15">0</p>
